Segmentation (LO-SGT)

Use

Businesses compete today in an increasingly customer-oriented market. Therefore, it becomes necessary to streamline internal processes and logistics around the needs of each market and its unique requirements through appropriate sourcing, planning, and supply of goods to meet market demands.

Some materials are expected to support large volumes of data. Segmentation can be used to order such materials by logically categorizing them based on certain criteria or characteristics.

For example, in the fashion industry, you can distinguish a fashion material such as a t-shirt based on the size and the color. This t-shirt in a particular size and color is called a material variant. You can enter a specific item line for a material variant. Using segmentation, you can also order material variants of different quality levels, for different customer channels, and from different countries of origin.

In material master, you can segment a material using segmentation structure and segmentation strategy.

Implementation Considerations

These functions are a part of the business function **Material Segmentation across Logistics (SD, MM, PP, IM, LE)** (`LOG_SEGMENTATION_03`).

Note

All the segmentation business functions can be activated only on the SAP HANA database.

Integration

Segmentation is integrated in the following applications:

- Material Master
- Sales and Distribution
- Materials Management
- Production Planning and Control

You can assign segments to a material using segmentation structure and segmentation strategy in the material master. You can configure these settings for segmentation in Customizing for **Segmentation** under **SAP Implementation Guide** > **Logistics - General**.

Features

There are two types of segments:

- Requirement segments
- Stock segments

The segment you assign to the materials in the requirements (for example, Sales Order, Planned Independent Requirement, Stock Transport Order) is called requirement segment. This allows you to subdivide your requirements based on certain criteria.

Example

The incoming requirements such as sales orders are divided based on the requested quality - Quality 1, Quality 2, or Quality 3, and by customer channel - Store, Wholesale, or E-Commerce.

Stock segments are used for logical distribution of existing and planned stock. Therefore, stock segments are assigned to both the physical stock and procurement proposals such as planned orders, production orders, purchase requisitions, and purchase orders.

Example

You can divide your stock based on the same criteria as the requirement, that is, by quality - Quality 1, Quality 2, or Quality 3 and by countries of origin - India, China, or Germany.

The segments influence the entire logistics chain. You can assign segments to a material using segmentation structure and segmentation strategy in the material master.

More Information

- Segmentation Structure
- Segmentation Strategy

Segmentation Structure

Definition

A segmentation structure is a combination of two or more segments of any material. For example, a segmentation structure can be a combination of quality, customer channel, and country of origin.

Use

Segmentation structures are defined in the Customizing for **Define Segmentation Structures** under **SAP Implementation Guide** > **Logistics - General** > **Segmentation**

Note

You have defined segmentation relevant characteristics using **Master Data Characteristics Management** (transaction `CT04`). For more information, see Maintain Segmentation Relevance for Functions.

More Information

- Segmentation (LO-SGT)
- Segmentation Strategy

Segmentation Strategy

Use

To efficiently plan your requirement, it is necessary to fulfill newly arising requirement (such as sales orders) with existing or future stock (for example, purchase requisition). If you have defined segments for your material, you can assign the stock to the requirement using these segments. Segmentation strategy determines how requirement segments are assigned to stock segments. This kind of assignment takes place during available-to-promise (ATP) check and material requirements planning (MRP).

Segmentation strategy is also important for the following requirement elements and stock elements:

- For externally procured materials during planning run. For example, during the creation of purchase requisitions.
- For the components of materials, i.e., the dependent requirements and the fulfillment of those requirements.
- For consumption of planned independent requirements using the actual customer requirements during the planning run.

Segmentation strategies are defined in the Customizing for **Define Segmentation Strategies** under **SAP Implementation Guide** > **Logistics - General** > **Segmentation**

Note

You have defined segmentation relevant characteristics using **Master Data Characteristics Management** (transaction CT04). For more information, see Maintain Segmentation Relevance for Functions.

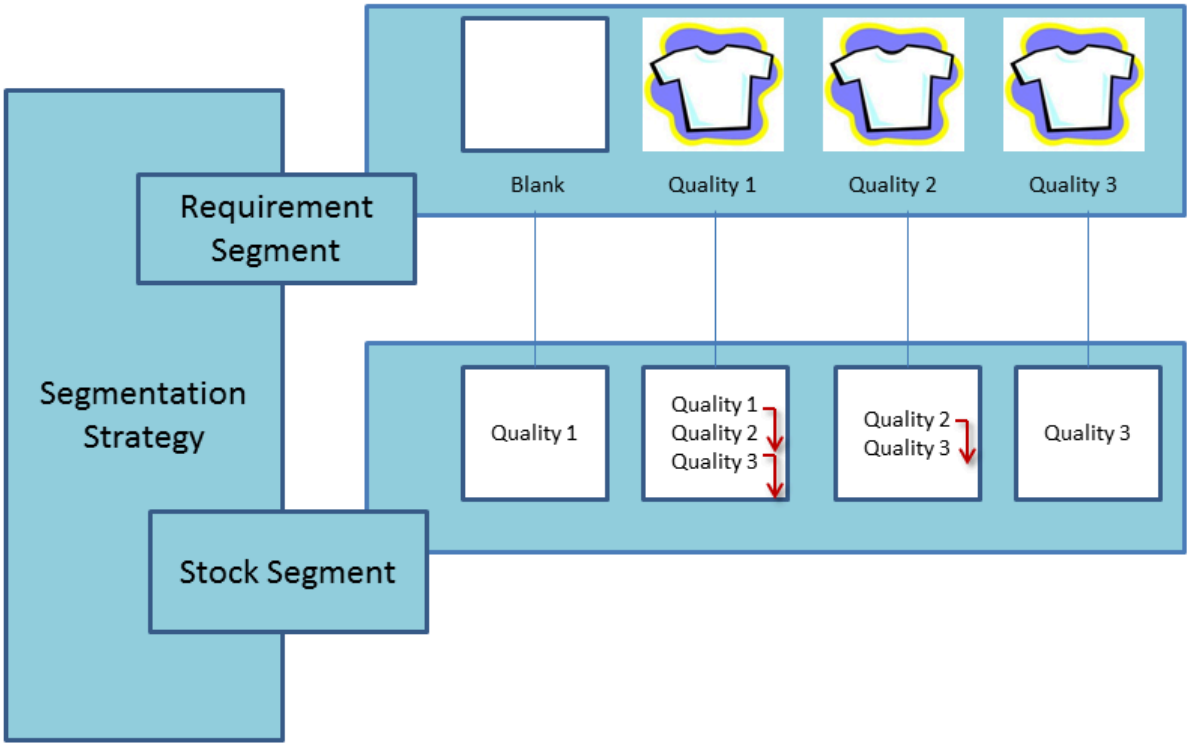
Features

Assignment of Stock or Requirement Segments

If you have assigned segments to a material, you can assign stock to the requirements using segmentation. The assignment of stock to requirements takes place during the planning run. The system determines which requirement segment is covered by which stock segment.

You determine the following sequence for your segmentation using your segmentation strategy:

1. You receive a requirement, such as a sales order. For example, the requirement belongs to customer segment **Wholesale** and is of quality **Quality 1**.
2. Using segmentation strategy, you define that this customer will receive the requested segment first, if you have the segment in stock.
3. If the requested segment is not in stock, you decide that the customer will receive available stock segment in the next level.



It is not mandatory to attach a segmentation structure or a segmentation strategy to a material.

A segmentation strategy can have multiple requirement segments but can be assigned to only one blank stock segment. Such segmentation strategies are identified by Scope in Segmentation Strategy. Scope indicates if the segmentation strategy only contains requirement segments or both requirement and stock segments.

Deletion of Segmentation Values

You can delete segmentation values for segmentation combinations. However, if you wish to delete multiple segmentation values, you can use the transaction `SE38` to execute the report program `SGT_DELETE_CATS`.

More Information

- Segmentation (LO-SGT)
- Segmentation Structure
- Scope in Segmentation Strategy

Scope in Segmentation Strategy

Use

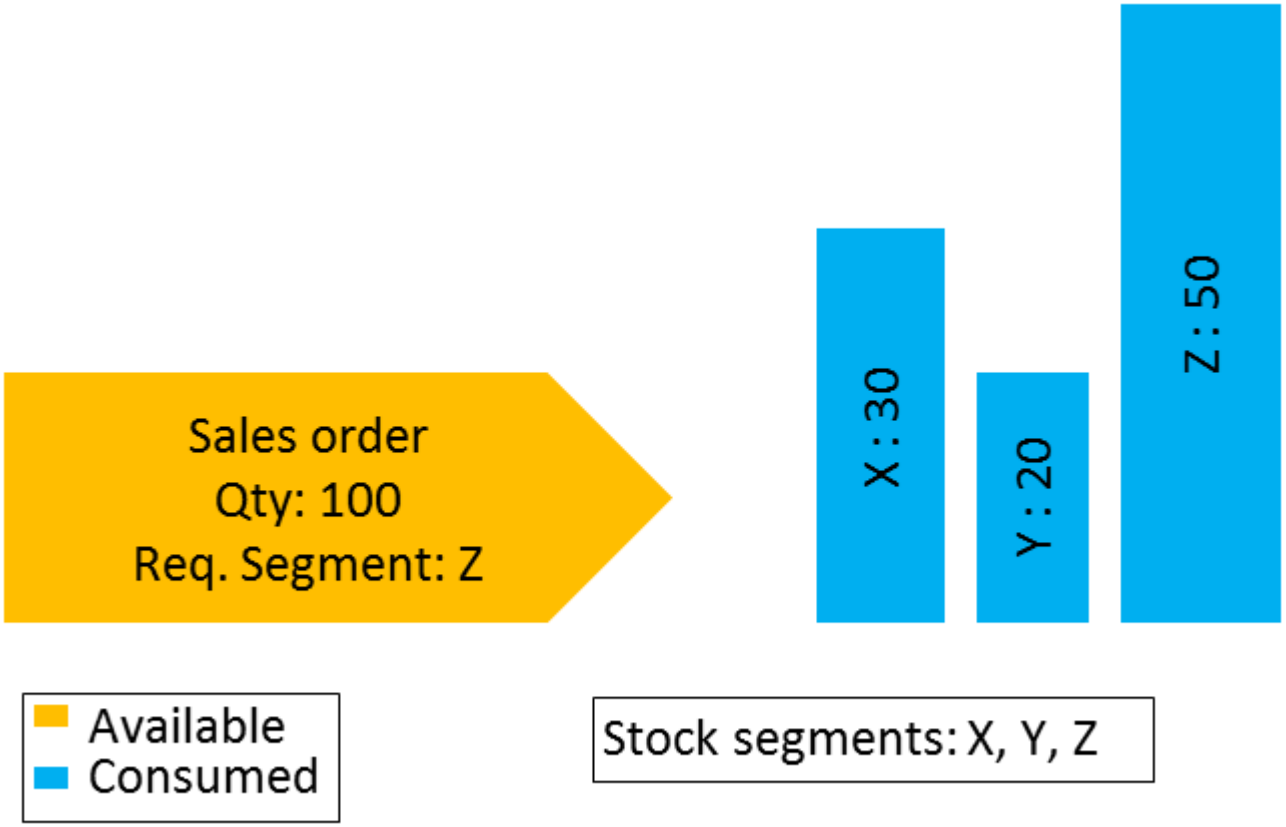
Scope is used to define the mapping rules or segment combinations in segmentation strategy. Scope can either be 1 or 2.

If the scope is 1, then both requirement segment and stock segment are considered during planning run. Mapping of requirement segment and stock segment can be 1:1 or 1:N.

Example

For 1:1 mapping, assume the requirement is for 100 pieces of segment X. As per this mapping, available stock of 30 pieces of segment X is consumed. As the requirement is not fulfilled, the system proposes to procure 70 pieces of segment X.

For 1:N mapping, assume the requirement is for 100 pieces of segment Z. As per this mapping, all available stock of 100 pieces in all three segments X, Y, and Z are procured.



If the scope is 2, then only requirement segment is considered during planning run. Stock segment is not considered. Customer requirements with specific requirement segments are covered by the common pool of stock available.

More Information

- Segmentation (LO-SGT)
- Segmentation Structure
- Segmentation Strategy

Maintain Segmentation Relevance for Functions

Use

This process allows you to maintain segmentation relevance for functions:

Prerequisites

You have defined a characteristics group (in Customizing) using the following steps:

1. In Customizing, navigate to **Cross-Application Components** > **Classification System** > **Characteristics** > **Define Characteristics Groups**.
2. Click **New Entries**.

3. Enter `SGT_SAP-C` under the **Group** field.
4. Enter **Characteristics for Segmentation** under the **Characteristics Group Description** field.
5. Save the entries. If the system prompts for the changes to be saved under a transport request, save the changes under a customizing transport request.

Process

You make you of the following steps to maintain segmentation relevance for functions:

1. Execute transaction `CT04`.
2. Enter the name of the **Characteristics**.
3. On the **Basic Data** tab page, enter the **Description**.
   a. Enter **Characteristics for Segmentation** as the **Chars Group**.
   b. Enter **Character Format** as the **Data Type**

      .

   c. Enter **Number of Chars**.
4. On the **Values** tab page, enter **Char. Value** and a corresponding **Description**.
5. On the **Addnl data** tab page, choose the **Relevance** pushbutton.

   Define Relevance for Functions overview screen in displayed.
6. Select the applications relevant for segmentation.
7. Choose **Save**.

ℹ Note

You can define segmentation structure and segmentation strategy for an application only if the application is made relevant for segmentation.

More Information

- Segmentation Structure
- Segmentation Strategy

Enabling Segmentation Relevancy

Use

You use this report to enable segmentation relevancy for the existing characteristics of a segmentation structure. The relevancy can be enabled to maintain segmentation relevant data for the following fields:

- Bill of Material (BOM)
- Routing (ROU)

- Season (SEA)
- Pricing (PRI)
- MRP General Data (MRM)
- MRP Quantity based Data
- Warehouse Management Level (WM1)
- Warehouse Management Storage Level (WM2)
- EAN

Prerequisites

- You have defined segmentation relevant characteristics using Master Data Characteristics Management (transaction `CT04`).
- You have defined segmentation structures for characteristics in the Customizing for **Define Segmentation Structures** under **Logistics - General** > **Segmentation** > **Segmentation Structures**

Features

On the report entry screen, you specify the range of segmentation structures that should be made segmentation relevant for `BOM`, `ROU`, `WM1`, and `WM2`. Based on your selection, the report displays the characteristics available in the segmentation structures along with an option to enable segmentation relevancy.

This is a one-time report. You can set the relevancy of the existing characteristics that were created for SAP Fashion Management 1.0 and SAP Fashion Management 1.0 SP 03 releases only.

Activities

1. Execute the program `SGT_SETRELEVANCE`.
2. Enter the range of segmentation structures to be enabled for relevancy
3. Select the relevancy checkbox for the selected structures.
4. Execute the report.

   The characteristics of the selected structures are displayed.
5. Save the changes. You cannot revert the changes after you have set the relevancy.

Segmentation: Enhancements to Material Master

Use

Segmentation logically categorizes materials based on certain criteria or certain characteristics of the material. From SAP ERP 6 EHP 7 SP 04 onwards, SAP has introduced a new business function `LOG_SEGMENTATION` which allows the concept of segmentation in core ERP processes. These enhancements to material master can be broadly divided into changes made to the client data and changes made to the plant data.

Features

Client Data

In client data, you must mark a material relevant for segmentation before assigning segmentation characteristics and their features to the material.

In the material master, you can specify if a material is relevant for segmentation or not by selecting the Segmentation Relevant checkbox. If you make a material relevant for segmentation, then you have to maintain the segmentation structure and strategy for that material. The Segmentation Structure and Segmentation Strategy fields appear only for segmentation relevant materials.

You can define if the Segmentation Structure and Segmentation Strategy fields should be mandatory or optional fields based on the Customizing activity Define Attributes of System Messages under Logistics - General > Material Master > Basic Settings.

After you set the segmentation structure and segmentation strategy, the Segmentation Strategy Scope maintained for the segmentation strategy is displayed in material master.

If you create a new material as a copy of an existing material, then the segmentation relevance, segmentation structure, and the segmentation strategy of the newly created material will be the same as that of the existing, reference material.

Segmentation structure and segmentation strategy can be changed in the change mode as long as segmentation is not fixed at the plant level. If segmentation is fixed for even one plant, segmentation structure and segmentation strategy cannot be changed.

Plant Data

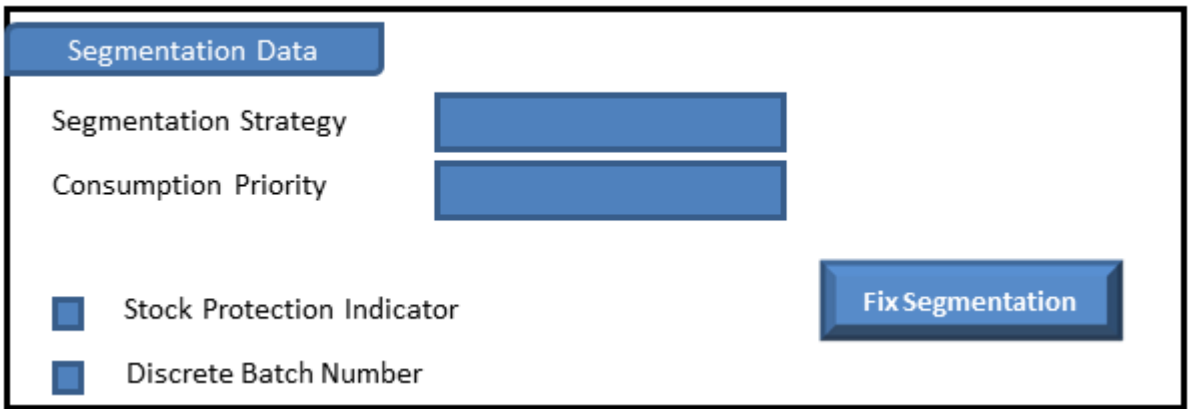
Segmentation Structure, Segmentation Strategy, Segmentation Strategy Scope, and Fix Segmentation

You can switch off segmentation in a plant, but you cannot set a different segmentation strategy for the same material in different plants.

You can change the segmentation strategy for plant data based on the following criteria:

- If the material is marked as segment relevant in client data
- Segmentation Structure and Segmentation Strategy fields are maintained in client data and the Segmentation Strategy is not fixed in plant data

You can then use the Fix Segmentation pushbutton to fix segmentation values for plants.



Material Master: Fix Segmentation

In some scenarios, you can change the segmentation assignment and fixing of segmentation strategy to a material using the Conversion of Material report. To access this report, on the SAP Easy Access menu, choose Logistics > Materials Management > Material Master > Material > Conversion of Material. You can also use the transaction `SGT_CONVERT_MATERIAL` to execute the report.

ℹ Note

You can use this report to change segmentation at the plant level only if no follow-on documents, for example sales orders, purchase orders, exist for the material.

If you create a new material as a copy of an existing material, then the segmentation strategy of the newly created material will not be copied from the reference material. This gives you the flexibility to decide the relevance of segmentation strategy at the plant level.

Consumption Priority

Consumption priority is used to whether planned independent requirements (PIRs) are consumed first based on the segments and then based on the consumption mode, or the other way round. With segmentation, you have one more option for consumption priority, which is, only if requirement segments match. You can maintain the **Consumption Priority** only if you have maintained segmentation strategy for a material. The **Seg. Strategy Scope** can be **1** or **2**.

Stock Protection Indicator

Stock protection is used in demand-supply matching processes that protect the stock for demands from high-priority requirement segments even when the actual demand is not yet available in the system. Stock protection allows businesses using a common stock pool for satisfying demands with different priorities to reserve stock for higher-priority demands against lower-priority demands that come in earlier. You can maintain the **Stock Protection Indicator** only if you have maintained segmentation strategy for a material. The **Seg. Strategy Scope** can be **1** or **2**.

Discrete Batch Number

Batch Management is also mandatory when a segmentation strategy is maintained for a material and the **Seg. Strategy Scope** is **1**.

Batch management also results in generation of batch numbers in sales and purchase documents. If you want to generate unique batch numbers during batch management, you can do so by selecting the **Discrete Batch Number** checkbox. This checkbox cannot be used on its own. It can only used in combination with the **Batch Management** checkbox and the **Scope** if the segmentation strategy is **1**.

More Information

Segmentation (LO-SGT)

Conversion of Material

Use

You can use this report to change the relevancy of a material for segmentation. You can also change the relevancy for order allocation run (ARun) and modify the season usage of a material.

You can make this change in the material master but it is a time-consuming process. Using this report, you can convert a material in a lesser span of time.

Features

You can convert a material using the following options:

- **Segmentation**: You can use this option to make a material relevant for segmentation (if the material was not relevant for segmentation when it was created) and vice versa. For example, if you make a material not relevant for segmentation, and later on, want to make the same material relevant for segmentation, it can be using this report at both the client and plant levels.
- **Order Allocation Run**: You can use this option to make a material ARun-relevant (if the material was not ARun-relevant when it was created), and vice versa.
- **Season**: You can use this option to change season usage of a material. If you have already assigned a season usage for a material when it was created in material master and later on, you want to change the season usage, it can be done using this report.

  For example, you had created a material with the season usage as **Use Season Year/Season** and now want to change the season usage as **Season Year / Season / Collection / Theme**, you can do this using the **Season** checkbox on the report.

i Note

This report only allows you to modify the indicators. If you want to assign a segmentation strategy or a segmentation structure to a material, it can only be done in the material master assignment. Similarly, you can change the season and ARun information of a material in the material master only.

You can use this report only if no follow-on documents, for example sales orders, purchase orders, exist for the material. Also, the presence of a purchasing info record does not allow a change in the segmentation assignment of an article. To enable segmentation for articles with follow-on documents, see 2018157.

Activities

Follow these steps to change the relevancy of a material for segmentation:

1. In the SAP Easy Access menu, choose **Logistics** > **Materials Management** > **Purchasing** > **Master Data** > **Subsequent Settlement** > **Vendor Rebate Arrangements** > **Environment** > **Condition/Arrangement** > **Environment** > **Material** > **Segmentation** > **Segmentation, ARun and Season Relevancy Conversion in Material**.
2. Enter a material number.
3. Select the required indicator to change the relevancy of a material.

Mass Maintenance of Material Master Data

Use

Maintaining master data can be time-consuming if you have to make each change individually. It is quicker to make one change and have the system automatically update all the affected records automatically. The mass maintenance tool enables you to change a large group of master data records at once.

You can select the mass maintenance tool within a number of master data transactions. All these mass maintenance tools are based on the same basic framework and user interface.

Features

You can mass maintain data related to the following segmentation related enhancements made to material master:

- segmentation structure

- segmentation strategy
- fix segmentation
- consumption priority
- stock protection indicator
- discrete batch management

Segmentation: Enhancements to Material Master

Interfaces for Material Segmentation

Use

IDoc (for intermediate document) is a standard data structure for electronic data interchange (EDI) between application programs written for the SAP business system or between an SAP application and an external program.

The following sections contain information on the interfaces relevant for material segmentation.

More Information

For more information about the **IDoc Interface/Electronic Data Interchange**, see **SAP Library** for **SAP ERP Central Component** on **SAP Help Portal**.

Material Master

In SAP ERP Logistics, you can associate the material master with segmentation characteristics by performing the following in the material master:

- Mark the material as relevant for segmentation by selecting the **Segmentation Relevant** checkbox.
- Assign segmentation structure and segmentation strategy for the materials at both the client data level and plant data level.

For a material that is relevant for segmentation, you must assign and fix the segmentation strategy. After fixing the segmentation strategy for a material, you cannot change the segmentation strategy assignment for the material. For a material that is relevant for segmentation, you can maintain segmentation-specific master data such as weights and volumes, sales block status, split valuation types and so on.

Technical Information: Material Master (MATMAS05)

The following section describes the enhanced standard IDoc segments of IDoc `MATMAS05`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Segment E1MARA1: Additional Fields for E1MARAM

Field	Short text	Explanation
SGT_CSGR	Segmentation Structure	Required only if the article is segmentation relevant. Contains all stock segment and requirement segment values valid for certain materials.
SGT_COVSA	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SGT_REL	Segmentation Relevant	Required only if the article is segmentation relevant. Indicates if the article is relevant for segmentation.

Segment E1MARCM: Master material C segment (MARC)

Field	Short text	Explanation
SGT_COVS	Segmentation Strategy	Required only if the article is segmentation relevant and the plant supports segmentation Strategy, else the value can be blank. Non Blank Segmentation Strategy should be same as that in client data.
SGT_STATC	Segmentation Status	Fix Status.
SGT_PRCM	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based on the segments or the consumption mode, and in which sequence.
SGT_CHINT	Discrete Batch Number	Decides whether batch numbering of materials with segmentation is active or not.
SGT_STK_PRT	Stock Protection Indicator	Indicates whether stock protection is enabled.
SGT_DEFSC	Default Stock Segment value	Segment value, which is (from the material valuation point of view) representative for all segment value combinations

Technical Information: Create and Change Material Master Data (MATMAS_BAPI02)

The following section describes the enhanced standard IDoc segments of IDoc `MATMAS_BAPI02`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Segment E1BP_MARC1: Material Data at Plant Level

Field	Short text	Explanation
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SEGMENTATION_STATUS	Segmentation Status	Fix Status.
CONSUMPTION_PRIORITY	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based on the segments or the consumption mode, and in which sequence.
DISCRETE_BATCH_FLAG	Discrete Batch Number	Decides whether batch numbering of materials with segmentation is active or not.
STOCK_PROTECTION_IND	Stock Protection Indicator	Indicates whether stock protection is enabled.
DEFAULT_STOCK_SEGMENT	Default Stock Segment value	Segment value, which is (from the material valuation point of view) representative for all segment value combinations

Segment E1BP_MARCX: Checkbox Structure for BAPI_MARC

Field	Short text	Explanation
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SEGMENTATION_STATUS	Segmentation Status	Fix Status.
CONSUMPTION_PRIORITY	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based on the segments or the consumption mode, and in which sequence.
DISCRETE_BATCH_FLAG	Discrete Batch Number	Decides whether batch numbering of materials with segmentation is active or not.
STOCK_PROTECTION_IND	Stock Protection Indicator	Indicates whether stock protection is enabled.

Field	Short text	Explanation
DEFAULT_STOCK_SEGMENT	Default Stock Segment value	Segment value, which is (from the material valuation point of view) representative for all segment value combinations

Technical Information: Create and Change Material Master Data (MATMAS_BAPI03)

The following section describes the enhanced standard IDoc segments of IDoc `MATMAS_BAPI03`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Segment E1BP_MARA1: Material Data at Client Level

Field	Short text	Explanation
SEGMENTATION_STRUCTURE	Segmentation Structure	Required only if the article is segmentation relevant. Contains all stock segment and requirement segment values valid for certain materials.
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SEGMENTATION_RELEVANCE	Segmentation Relevant	Required only if the article is segmentation relevant. Indicates if the article is relevant for segmentation.

Segment E1BP_MARAX: Checkbox Structure for BAPI_MARA

Field	Short text	Explanation
SEGMENTATION_STRUCTURE	Segmentation Structure	Required only if the article is segmentation relevant. Contains all stock segment and requirement segment values valid for certain materials.
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.

Field	Short text	Explanation
SEGMENTATION_RELEVANCE	Segmentation Relevant	Required only if the article is segmentation relevant. Indicates if the article is relevant for segmentation.

Segment E1BP_MARC1: Material Data at Plant Level

Field	Short text	Explanation
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SEGMENTATION_STATUS	Segmentation Status	Fix Status.
CONSUMPTION_PRIORITY	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based on the segments or the consumption mode, and in which sequence.
DISCRETE_BATCH_FLAG	Discrete Batch Number	Decides whether batch numbering of materials with segmentation is active or not.
STOCK_PROTECTION_IND	Stock Protection Indicator	Indicates whether stock protection is enabled.
DEFAULT_STOCK_SEGMENT	Default Stock Segment value	Segment value, which is (from the material valuation point of view) representative for all segment value combinations

Segment E1BP_MARCX: Checkbox Structure for BAPI_MARC

Field	Short text	Explanation
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SEGMENTATION_STATUS	Segmentation Status	Fix Status.
CONSUMPTION_PRIORITY	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based

Field	Short text	Explanation
		on the segments or the consumption mode, and in which sequence.
DISCRETE_BATCH_FLAG	Discrete Batch Number	Decides whether batch numbering of materials with segmentation is active or not.
STOCK_PROTECTION_IND	Stock Protection Indicator	Indicates whether stock protection is enabled.
DEFAULT_STOCK_SEGMENT	Default Stock Segment value	Segment value, which is (from the material valuation point of view) representative for all segment value combinations

Technical Information: BAPI for Mass Maintenance of Material Data

The following section describes the enhanced standard IDoc segments of the following IDocs:

- MATMAS_MASS_BAPI01
- MATMAS_MASS_BAPI02

The fields contained in the segments are all listed with the field name, short text, and functional description.

Segment E1BPE1MARC1: Material Data at Plant Level

Field	Short text	Explanation
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SEGMENTATION_STATUS	Segmentation Status	Fix Status.
CONSUMPTION_PRIORITY	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based on the segments or the consumption mode, and in which sequence.
DISCRETE_BATCH_FLAG	Discrete Batch Number	Decides whether batch numbering of materials with segmentation is active or not.
STOCK_PROTECTION_IND	Stock Protection Indicator	Indicates whether stock protection is enabled.
DEFAULT_STOCK_SEGMENT	Default Stock Segment value	Segment value, which is (from the material valuation point of view) representative for

Field	Short text	Explanation
		all segment value combinations

Segment E1BPE1MARCX: Checkbox Structure for BAPIE1MARC

Field	Short text	Explanation
SEGMENTATION_STRATEGY	Segmentation Strategy	Required only if the article is segmentation relevant. A strategy that is a collection of business rules that define which stock materials should satisfy which demand objects. This is done based on the mapping between stock segment associated with a material in stock and requirement segment associated with a demand object.
SEGMENTATION_STATUS	Segmentation Status	Fix Status.
CONSUMPTION_PRIORITY	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based on the segments or the consumption mode, and in which sequence.

CONSUMPTION_PRIORITY	Consumption Priority	Indicates whether planned independent requirements (PIRs) are consumed based on the segments or the consumption mode, and in which sequence.
DISCRETE_BATCH_FLAG	Discrete Batch Number	Decides whether batch numbering of materials with segmentation is active or not.
STOCK_PROTECTION_IND	Stock Protection Indicator	Indicates whether stock protection is enabled.
DEFAULT_STOCK_SEGMENT	Default Stock Segment value	Segment value, which is (from the material valuation point of view) representative for all segment value combinations

Materials Management

The following sections contain information on the area of Materials Management.

Purchasing Info Record

Use

Purchasing info records can be created and updated using IDoc interfaces. SAP ERP Logistics IDocs are enhanced primarily in the areas of processing material segmentation.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1EINAM`: Purchasing Info Record: General Data
  - `E1EALTH`: Text Identification for Purchasing Info Record: General Data
  - `E1EINEM`: Purchasing Info Record: Purchasing Organization Data
    - `E1EELTH`: Text ID for Purchasing Info Record: Purchasing Org. Data
    - `E1ESEGM`: Purchasing Info Record: Segmentation Specific Data

Technical Information: Purchasing Info Record (INFREC02)

The following section describes the material segmentation-specific segment of IDoc `INFREC02`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Document Item: Purchasing Info Record: Segmentation Specific Data (E1ESEGM)

To enter material segmentation information for the materials when you create a purchasing info record, you can use the standard IDoc segment `E1ESEGM`.

Field	Short text	Explanation
STK_SEGMENT	Stock Segment	Segment assigned to a stockable item.

Technical Information: Purchasing Info Records (Mass IDOC) (INFRECMASS02)

The following section describes the material segmentation-specific segment of IDoc `INFRECMASS02`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Document Item: Purchasing Info Record: Segmentation Specific Data (E1ESEGM)

To enter material segmentation information for the materials when you create a purchasing info record, you must use the standard IDoc segment `E1EINAM` to pass the purchasing info record details and use the IDoc segment `E1ESEGM` to pass segmentation-specific details.

Field	Short text	Explanation
STK_SEGMENT	Stock Segment	Segment assigned to a stockable item.

Purchase Requisition

Purchasing requisitions can be created and updated using IDoc interfaces. SAP ERP Logistics IDocs are enhanced primarily in the areas of processing material segmentation.

Technical Information: Create Enjoy Purchase Requisition (PREQCR102)

Use

The following section describes the material segmentation-specific segment of IDoc PREQCR102. The fields contained in the segments are all listed with the field name, short text, and functional description.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1PREQCR1`: Header Segment
  - `E1BPMEREQHEADER`: Transfer Structure for Enjoy Purchase Req. - Header
  - `E1BPMEREQHEADERX`: Change Parameter for Enjoy Purchase Requisition - Header
  - `E1BPMEREQITEMX`: Change Parameter for Enjoy Purchase Requisition - Item Data
    - `E1BPMEREQITEM`: Transfer Structure for Enjoy Purchase Req. - Item Data
      - `E1BPMEREQITEM1`: Transfer Structure for Enjoy Purchase Req. - Item Data

Document Item: Transfer Structure for Enjoy Purchase Req. - Item Data (E1BPMEREQITEM1)

To enter material segmentation information for the materials when you create a purchase requisition, you can use the standard IDoc segment `E1BPMEREQITEM1`.

Field	Short text	Explanation
STK_SEGMENT	Stock Segment	Segment assigned to a stockable item.

Technical Information: Change Enjoy Purchase Requisition (PREQCHANGE02)

Use

The following section describes the material segmentation-specific segment of IDoc `PREQCHANGE02`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1PREQCR1`: Header Segment
  - `E1BPMEREQHEADER`: Transfer Structure for Enjoy Purchase Req. - Header
  - `E1BPMEREQHEADERX`: Change Parameter for Enjoy Purchase Requisition - Header
  - `E1BPMEREQITEMIMP`: Change Toolbar for Enjoy Purchase Req. - Item
  - `E1BPMEREQITEMX`: Change Parameter for Enjoy Purchase Requisition - Item Data
    - `E1BPMEREQITEM`: Transfer Structure for Enjoy Purchase Req. - Item Data
      - `E1BPMEREQITEM1`: Transfer Structure for Enjoy Purchase Req. - Item Data

Document Item: Transfer Structure for Enjoy Purchase Req. - Item Data (E1BPMEREQITEM1)

To enter material segmentation information for the materials when you change a purchase requisition, you can use the standard IDoc segment `E1BPMEREQITEM1`.

Field	Short text	Explanation
`STK_SEGMENT`	Stock Segment	Segment assigned to a stockable item.
`REQ_SEGMENT`	Requirement Segment	Indicates additional information about the type of requirement.

Technical Information: Get Details for One MEREQ Object (PREQGETDETAIL02)

Use

The following section describes the material segmentation-specific segment of IDoc `PREQGETDETAIL02`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1PREQGETDETAIL`: Header Segment
  - `E1BPMEREQITEM`: Transfer Structure for Enjoy Purchase Req. - Item Data
    - `E1BPMEREQITEM1`: Transfer Structure for Enjoy Purchase Req. - Item Data
  - `E1BPMEREQACCOUNT`: Transfer Structure for Enjoy Purchase Req. - Acct Assignment

Document Item: Transfer Structure for Enjoy Purchase Req. - Item Data (E1BPMEREQITEM1)

To enter material segmentation information for the materials when you change a purchase requisition, you can use the standard IDoc segment `E1BPMEREQITEM1`.

Field	Short text	Explanation
`STK_SEGMENT`	Stock Segment	Segment assigned to a stockable item.
`REQ_SEGMENT`	Requirement Segment	Indicates additional information about the type of requirement.

Purchase Order

Purchasing documents can be created and updated using IDoc interfaces. SAP ERP Logistics IDocs are enhanced primarily in the areas of processing material segmentation.

Technical Information: Purchase Order Item (PORDCR103)

Use

The following section describes the segmentation-specific segment of IDoc PORDCR103. The fields contained in the segments are all listed with the field name, short text, and functional description.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1PORDCR1`: Header Segment
  - `E1BPMEPOHEADER`: Purchase Order Header Data
  - `E1BPMEPOHEADERX`: Purchase Order Header Data (Change Parameter)
  - `E1BPMEPOITEM`: Purchase Order Item

Document Item: Purchase Order Item (E1BPMEPOITEM1)

To enter segmentation information for the materials when you create a purchasing document, you can use the standard IDoc segment `E1BPMEPOITEM1`.

Field	Short text	Explanation
`STK_SEGMENT`	Stock Segment	Segment assigned to a stockable item.

Technical Information: Change Purchase Order (PORDCH03)

Use

The following section describes the segmentation-specific segment of IDoc `PORDCH03`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1PORDCR1`: Header Segment
  - `E1BPMEPOHEADER`: Purchase Order Header Data
  - `E1BPMEPOHEADERX`: Purchase Order Header Data (Change Parameter)
  - `E1BPMEPOITEM`: Purchase Order Item
    - `E1BPMEPOITEM1`: Purchase Order Item
  - `E1BPMEPOITEMX`: Purchase Order Item Data (Change Parameter)

Document Item: Purchase Order Item (E1BPMEPOITEM1)

To enter segmentation information for the materials when you create a purchasing document, you can use the standard IDoc segment `E1BPMEPOITEM1`.

Field	Short text	Explanation
`STK_SEGMENT`	Stock Segment	Segment assigned to a stockable item.
`REQ_SEGMENT`	Requirement Segment	Indicates additional information about the type of requirement.

Technical Information: Detail Information for a Purchase Order (PORDGD102)

Use

The following section describes the segmentation-specific segment of IDoc `PORDGD102`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1PORDGD1`: Header Segment
  - `E1BPMEPOITEM`: Purchase Order Item
    - `E1BPMEPOITEM1`: Purchase Order Item

Document Item: Purchase Order Item (E1BPMEPOITEM1)

To enter segmentation information for the materials when you create a purchasing document, you can use the standard IDoc segment `E1BPMEPOITEM1`.

Field	Short text	Explanation
`STK_SEGMENT`	Stock Segment	Segment assigned to a stockable item.
`REQ_SEGMENT`	Requirement Segment	Indicates additional information about the type of requirement.

Goods Movement

Use

The section describes the IDoc required for various movement types.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1MBGMCR`: Header Segment
  - `E1BP2017_GM_HEAD_01`: BAPI Communication Structure: Material Document Header Data
  - `/SPE/E1BP2017_GM_REF_EWM`: BAPI Communication Structure: Material Document EWM Ref.
  - `E1BP2017_GM_ITEM_CREATE`: BAPI Communication Structure: Create Material Document Item
    - `E1BP2017_GM_ITEM_CREATE1`: BAPI Communication Structure: Create Material Document Item

Technical Information: Post Goods Movements with MB_CREATE_GOODS_MOVEMENT (MBGMCR03)

The following section describes the enhanced standard IDoc segments of IDoc `MBGMCR03`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Document Item: Post Goods Movements with MB_CREATE_GOODS_MOVEMENT (E1BP2017_FSH_GM_ITEM_CREATE1)

To enter segmentation information for the materials in the goods movement document, you can use the standard IDoc segment `E1BP2017_GM_ITEM_CREATE1`.

Field	Short text	Explanation
`STK_SEGMENT`	Stock Segment	Segment assigned to a stockable item.

Purchasing and Sales

Use

Purchasing documents and sales documents can be created and updated using IDoc interfaces. SAP ERP Logistics IDocs are enhanced primarily in the areas of processing material segmentation.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1EDK01` IDoc: Document header general data
- `E1EDK14` IDoc: Document Header Organizational Data
- `E1EDK03` IDoc: Document header date segment
- `E1EDKA1` IDoc: Document Header Partner Information
- `E1EDP01` IDoc: Document Item General Data
  - `E1EDP20` IDoc schedule lines
  - `E1EDP19` IDoc: Document Item Object Identification

Technical Information: Purchasing/Sales (ORDERS05)

The following section describes the enhanced standard IDoc segments of IDoc `ORDERS05`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Segment: IDoc: Document Item General Data (E1EDP01)

To enter segmentation values for the materials in the sales document or the purchasing document, you can use the standard IDoc segment `E1EDP01`.

Field	Short text	Explanation
`SGT_RCAT`	Requirement Segment	Indicates additional information about the type of requirement.
`SGT_SCAT`	Stock Segment	Segment assigned to a stockable item.

Sales and Distribution

The following sections contain information on the area of Sales and Distribution.

Delivery Interface

Use

Outbound IDocs contain all relevant delivery information. Standard IDocs for outbound are enhanced primarily in the area of processing material segmentation data.

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- E1EDL20 Delivery header
- E1EDL21 Delivery Header Additional Data
- E1EDT13 IDoc: Deadline (delivery)
- E1EDL33 Export Data Delivery Header
- E1EDL24 Delivery Item
    - E1EDL26 Delivery Item Additional Data

Technical Information: Delivery Interface (DELVRY07)

The following section describes the enhanced standard IDoc segments of IDoc `DELVRY07`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Segment: Delivery Item Additional Data (E1EDL26)

To enter segmentation information for the materials in the delivery document, you can use the standard IDoc segment `E1EDL26`.

Field	Short text	Explanation
`SGT_RCAT`	Requirement Segment	Indicates additional information about the type of requirement.
`SGT_SCAT`	Stock Segment	Segment assigned to a stockable item.

Invoice or Billing Document

Use

Invoice or Billing Document

Prerequisites

You created the following standard IDoc segments before supplying data for the segments specific to material segmentation:

- `E1EDK01` IDoc: Document header general data
- `E1EDKA1` IDoc: Document Header Partner Information
- `E1EDK02` IDoc: Document header reference data
- `E1EDK03` IDoc: Document header date segment
- `E1EDK14` IDoc: Document Header Organizational Data
- `E1EDP01` IDoc: Document Item General Data

- `E1EDP03` IDoc: Document Item Date Segment
- `E1EDP19` IDoc: Document Item Object Identification
- `E1EDP26` IDoc: Document Item Amount Segment

Technical Information: Invoices (INVOIC02)

The following section describes the enhanced standard IDoc segments of IDoc `INVOIC02`. The fields contained in the segments are all listed with the field name, short text, and functional description.

Segment: IDoc: Document Item General Data (E1EDP01)

To enter segmentation information for the materials in the invoice document, you can use the standard IDoc segment `E1EDP01`.

Field	Short text	Explanation
`SGT_RCAT`	Requirement Segment	Indicates additional information about the type of requirement.
`SGT_SCAT`	Stock Segment	Segment assigned to a stockable item.

Planning and Production

The following sections contain information on Planning and Production (PP).

Master Data: Material BOM

For an integrated materials management and shop floor control, BOMs and work plans contain critical basic or master data. In the engineering/design department the functional and production conform design takes place for a new product to be produced. The results of this product phase are drawings and a list of all necessary parts, the BOM.

BOMs are found in varying forms everywhere where end products are composed of several basic parts or materials.

One of the steps you should carry out when you start up PP in the SAP system is the transfer of BOMs from a legacy system. This step is required because it is not usually possible to create initial data manually in the R/3 system due to the multitude of BOMs used.

Typical application examples are:

- Transfer of BOMs from a non-SAP system
- Transfer of data from data pools

Segmentation Special Features

You can use the new IDoc type `BOMMAT07` to create material BOMs with segmentation information.

- **Mapping of Segmentation**: Using ALE, segmentation information are mapped in the same way as in the dialog transaction.

Technical Information: Bill of Materials

Technical Description of the IDoc Type

Document Type	Direction	Logical Message	IDoc Type	Process Code
Bill of material	Inbound	BOMMAT	BOMMAT07	BOMM

Segmentation-Specific Fields for Bills of Materials

Segment	Field	Explanation	Origin
E1SGTBOM	MSGFN	Function	Same processing like in standard • 003-Delete: Message contains objects to be deleted • 004-Change: Message contains changes • 005-Replace: This message replaces previous messages • 009-Original: First message for process • 023-Wait/Adjust: Do not import data • 018-Resend
	STOCK_SEGMENT	Stock Segment	Segmentation value for requirement segment or stock segment which contains one value of a segmentation field or a combination of values for all segmentation fields.
	SEGMENTATION_INCLUDE	Segmentation : Flag Including	Includes or excludes components or routings for selected segment values of the header material.
	SEGMENTATION_EXCLUDE	Segmentation: Flag Excluding	Includes or excludes components or routings for the selected segment values of the header material.

Master Data: Sales Order BOM

For an integrated materials management and shop floor control, BOMs and work plans contain critical basic or master data. In the engineering/design department the functional and production conform design takes place for a new product to be produced. The

results of this product phase are drawings and a list of all necessary parts, the BOM. BOMs are found in varying forms everywhere where end products are composed of several basic parts or materials.

One of the steps you should carry out when you start up PP in the SAP system is the transfer of BOMs from a legacy system. This step is required because it is not usually possible to create initial data manually in the R/3 system due to the multitude of BOMs used.

Typical application examples are:

- Transfer of BOMs from a non-SAP system
- Transfer of data from data pools

Segmentation Special Features

You can use the new IDoc type `BOMORD03` to create order BOMs with segmentation information.

- **Mapping of Segmentation**: Using ALE, segmentation information are mapped in the same way as in the dialog transaction.

Technical Information: Bill of Materials

Technical Description of the IDoc Type

Document Type	Direction	Logical Message	IDoc Type	Process Code
Bill of material	Inbound	`BOMORD`	`BOMORD03`	BOMM

Segmentation-Specific Fields for Bills of Materials

Segment	Field	Explanation	Origin
`E1SGTBOM`	`MSGFN`	Function	Same processing like in standard • 003-Delete: Message contains objects to be deleted • 004-Change: Message contains changes • 005-Replace: This message replaces previous messages • 009-Original: First message for process • 023-Wait/Adjust: Do not import data • 018-Resend
	`STOCK_SEGMENT`	Stock Segment	Segmentation value for requirement segment or stock

Segment	Field	Explanation	Origin
			segment which contains one value of a segmentation field or a combination of values for all segmentation fields.
	SEGMENTATION_INCLUDE	Segmentation : Flag Including	Includes or excludes components or routings for selected segment values of the header material.
	SEGMENTATION_EXCLUDE	Segmentation: Flag Excluding	Includes or excludes components or routings for the selected segment values of the header material..
